

Tri-generation concepts: A lab-facility for combined heat, power and cooling generation

Prof. Dr.-Ing. Willi Nieratschker

Prof. Dr.-Ing. Marc Nadler

Christian Braasch, M.Eng.

ACA-MODES

Tri-generation concepts

31.01.2020, Workshop

Outline

- Introduction/Overview on Demand
- Combined cooling heating power systems
- Lab-facility at HS-Koblenz

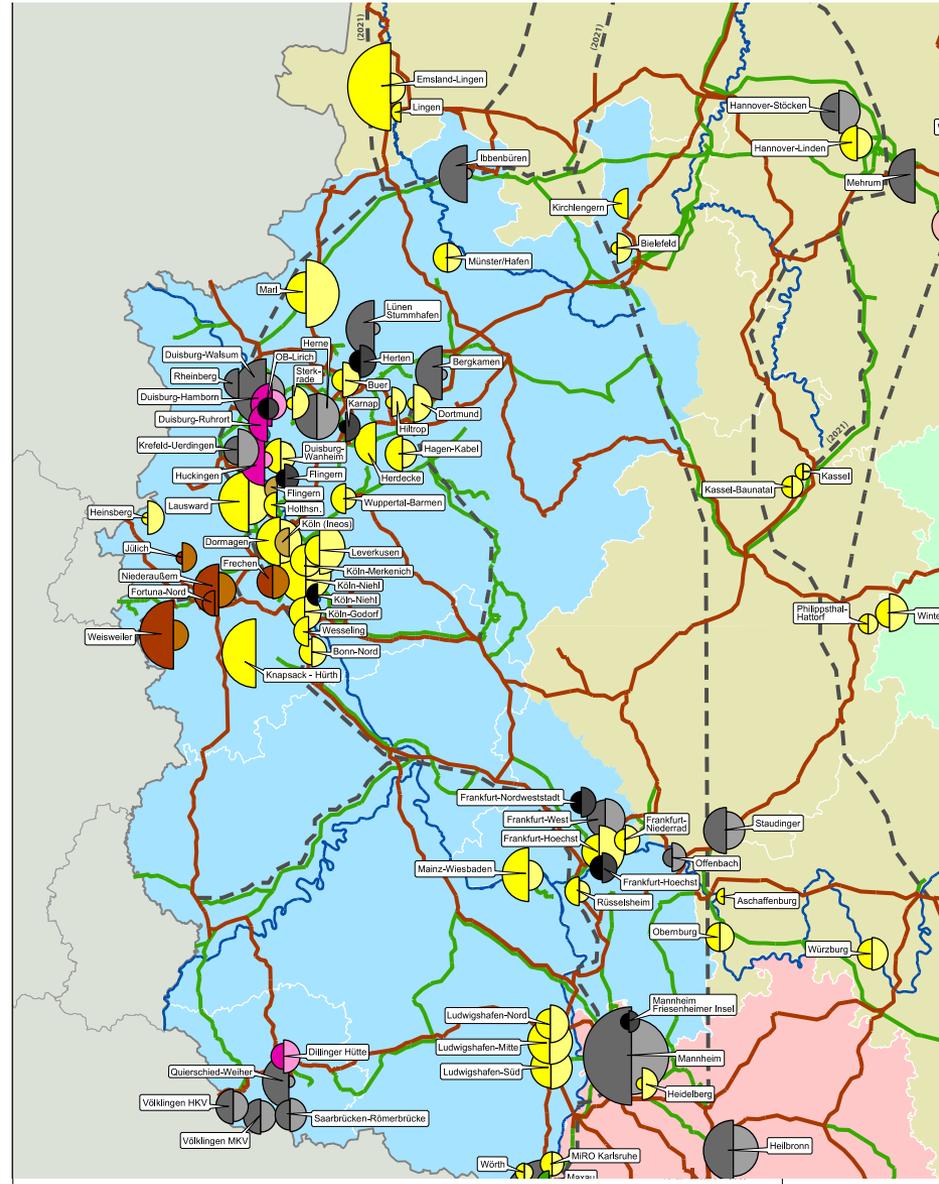

ACA-MODES

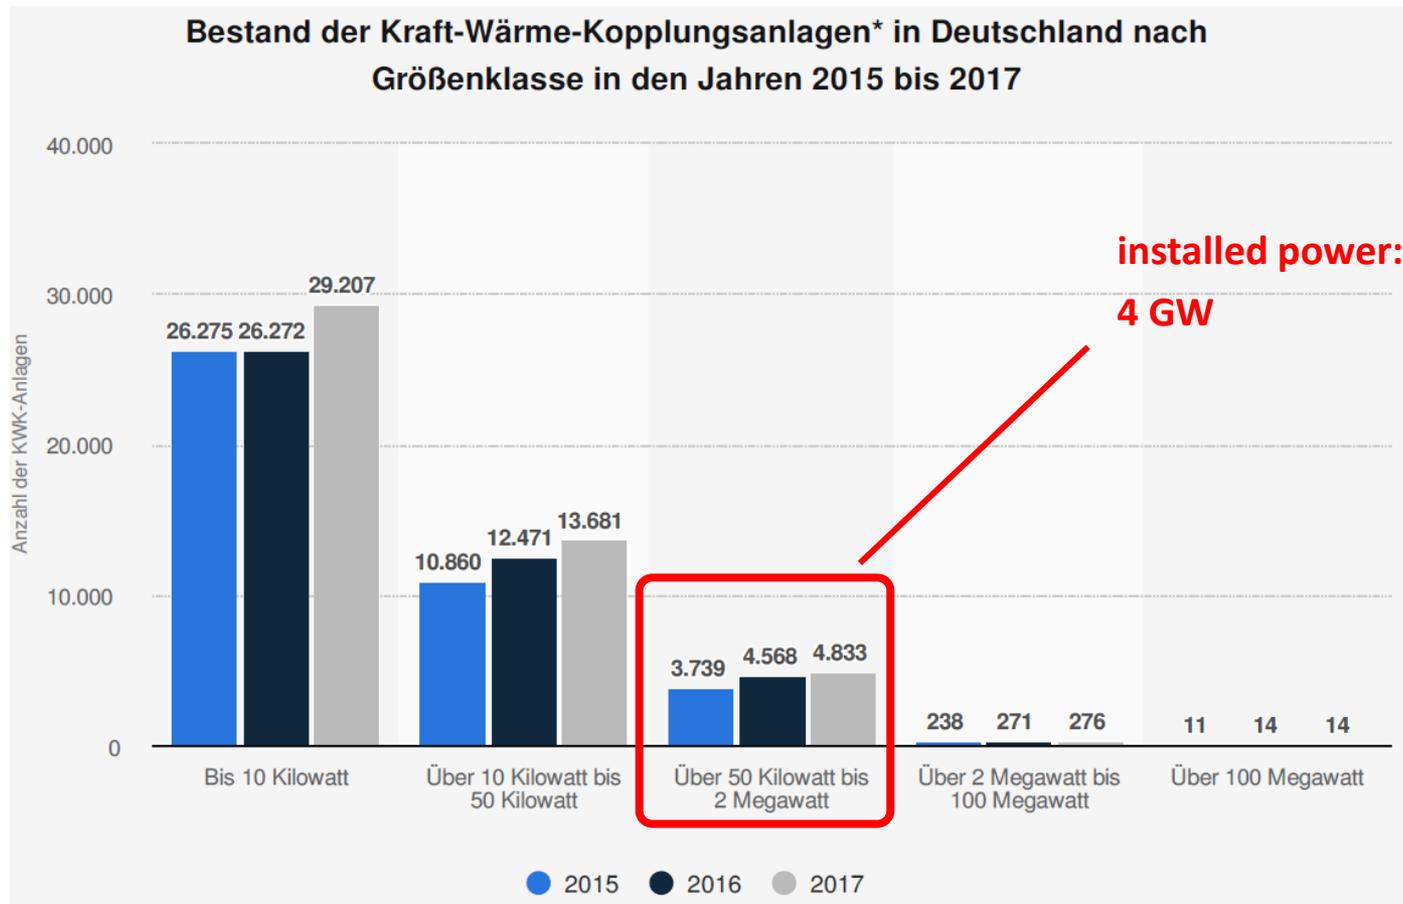

Tri-generation concepts

31.01.2020, Workshop

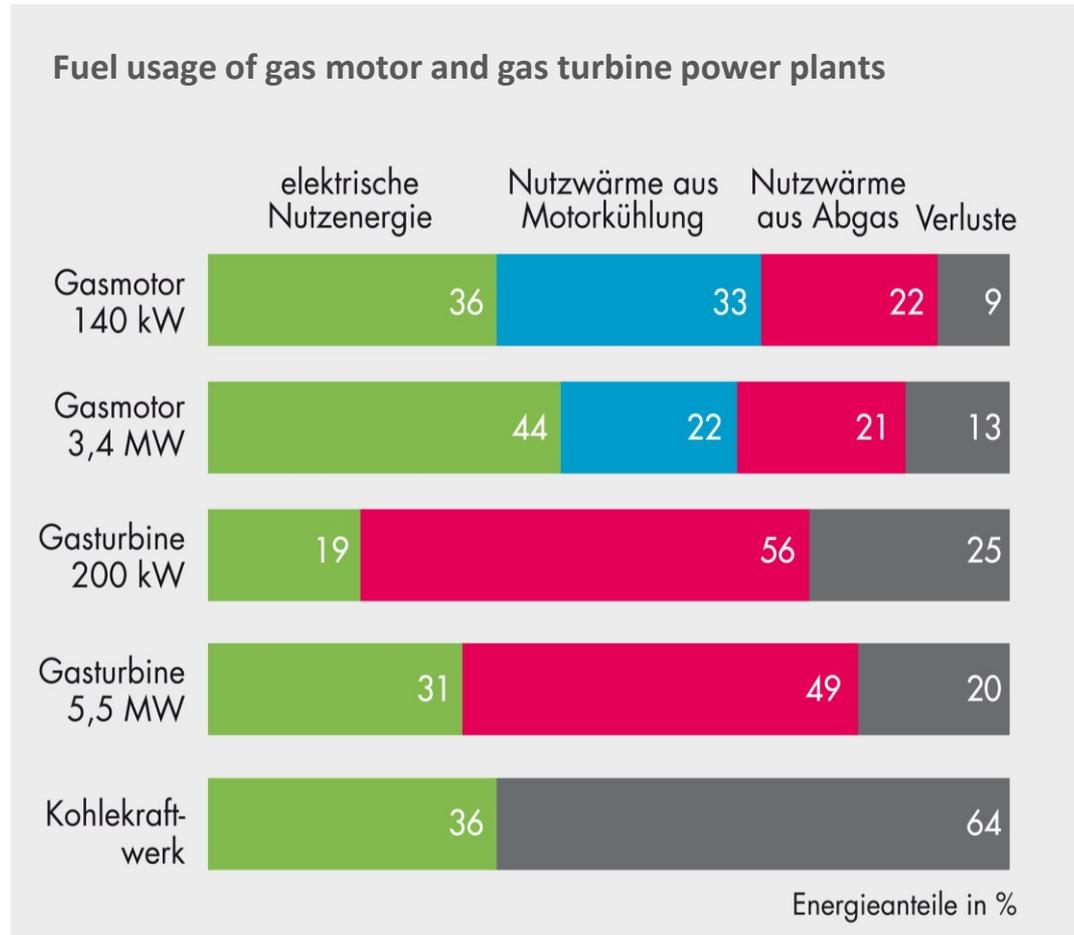

CHP-Plants > 50 MW in Germany in 2019

Quantity of existing CHP-Plants in different size categories Germany 2015 - 2017

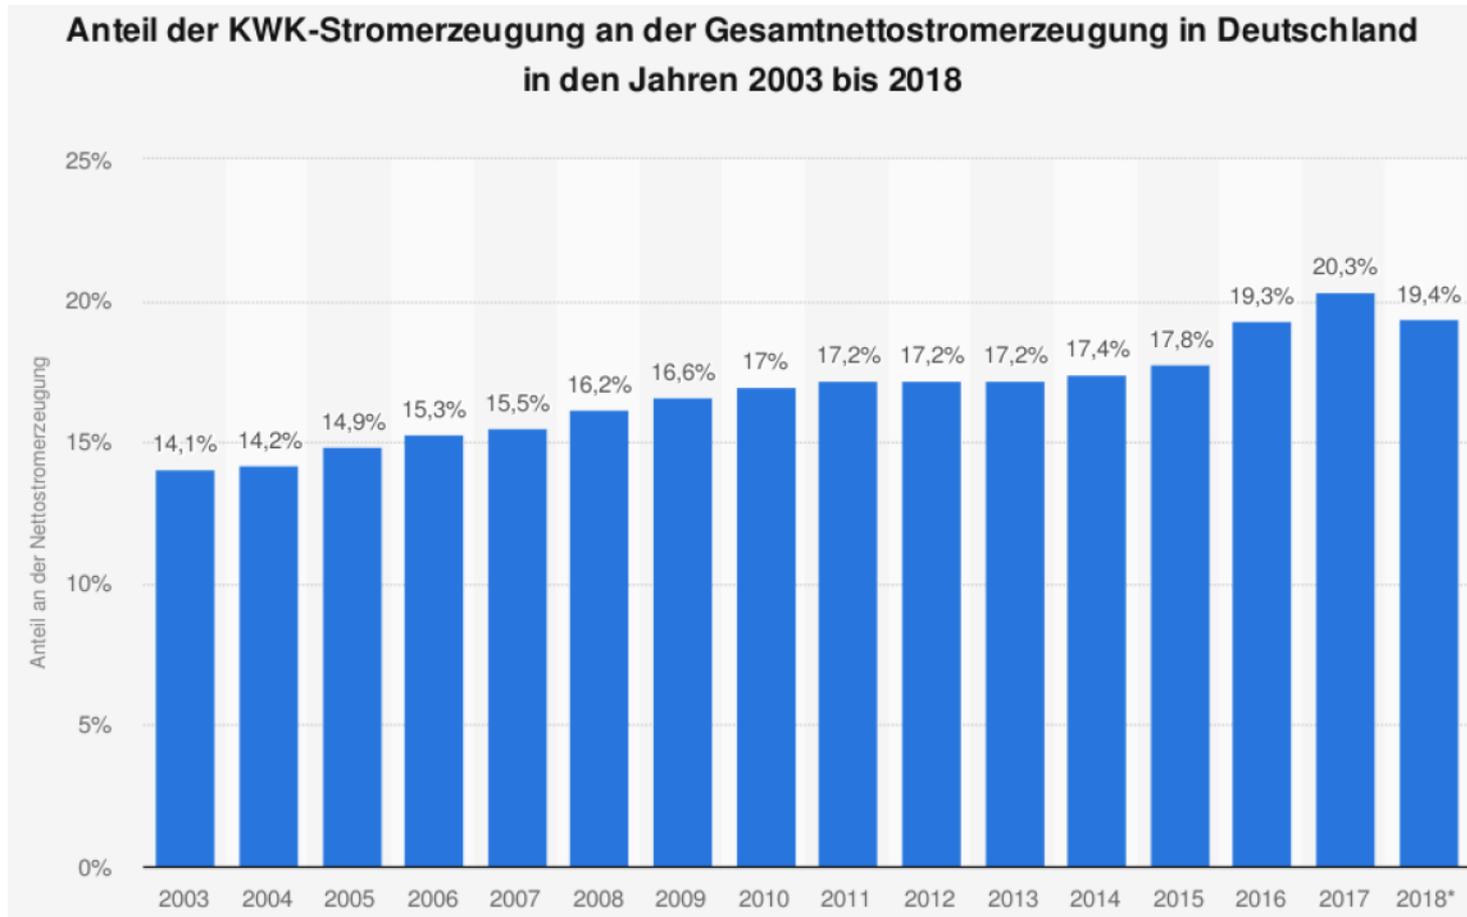

Comparison of efficiencies depending on power range

[www.asue.de]

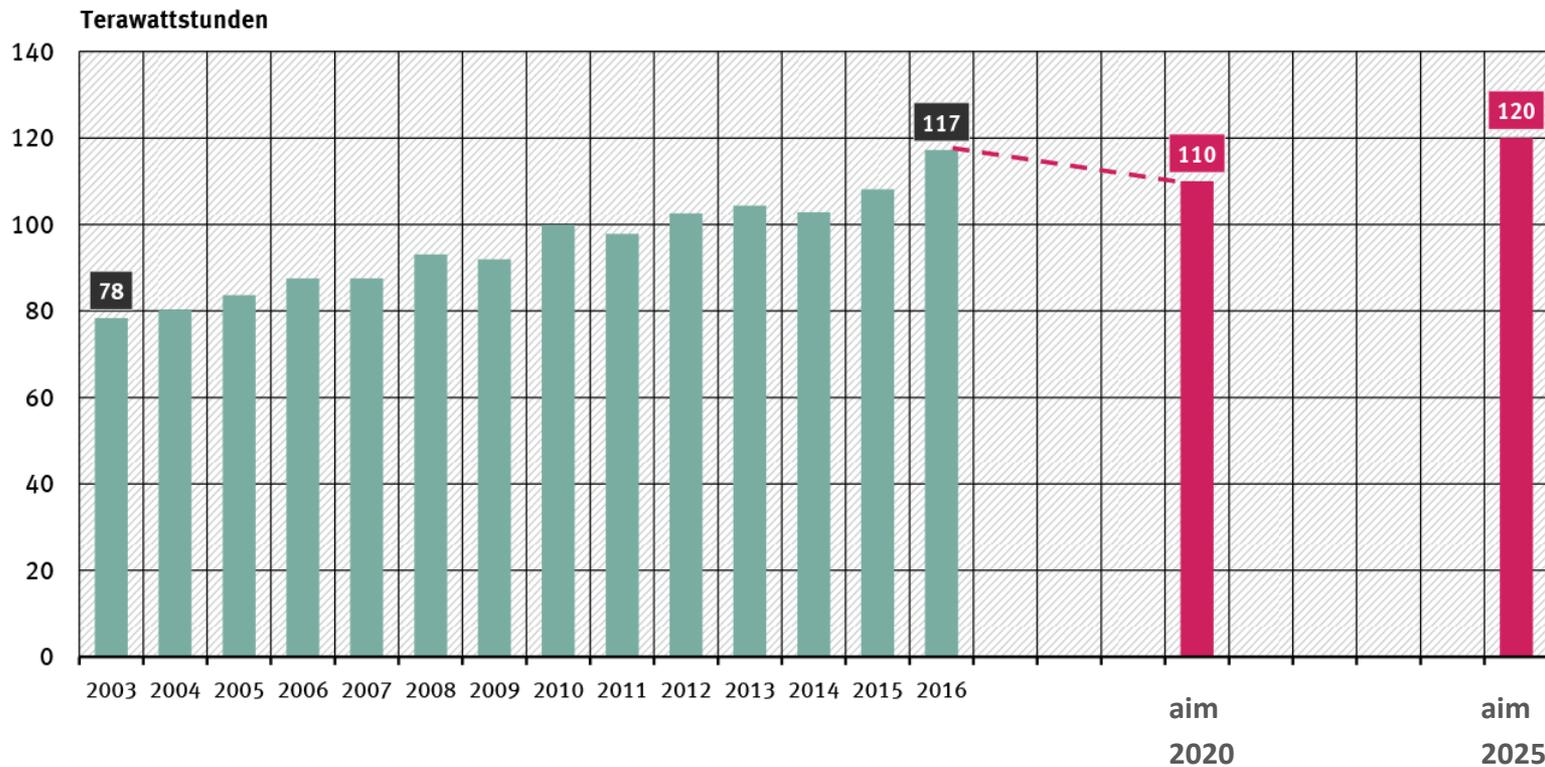

Share of power generation by CHP in Germany 2003 to 2018

Power generation by CHP in Germany 2003 to 2018

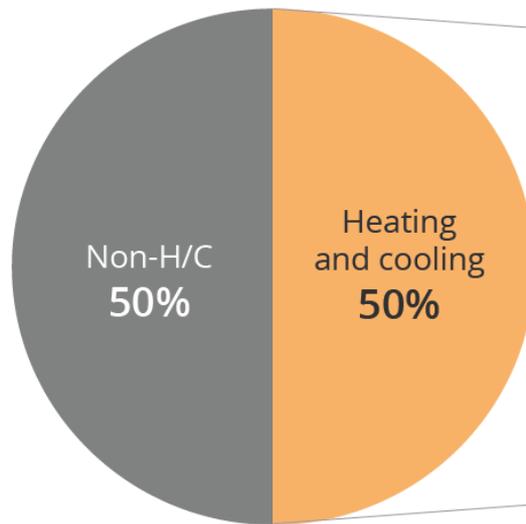

Nettostromerzeugung mit Kraft-Wärme-Kopplung (KWK)

Vergleich der Entwicklung der KWK-Nettostromerzeugung mit den Zielen der Bundesregierung*

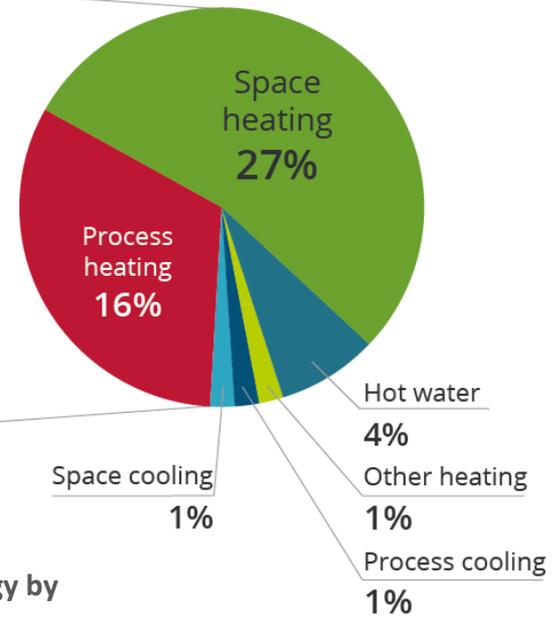

[Statistisches Bundesamt; Ökoinstitut, Umweltbundesamt 11/2017]

Energy usage EUROPE

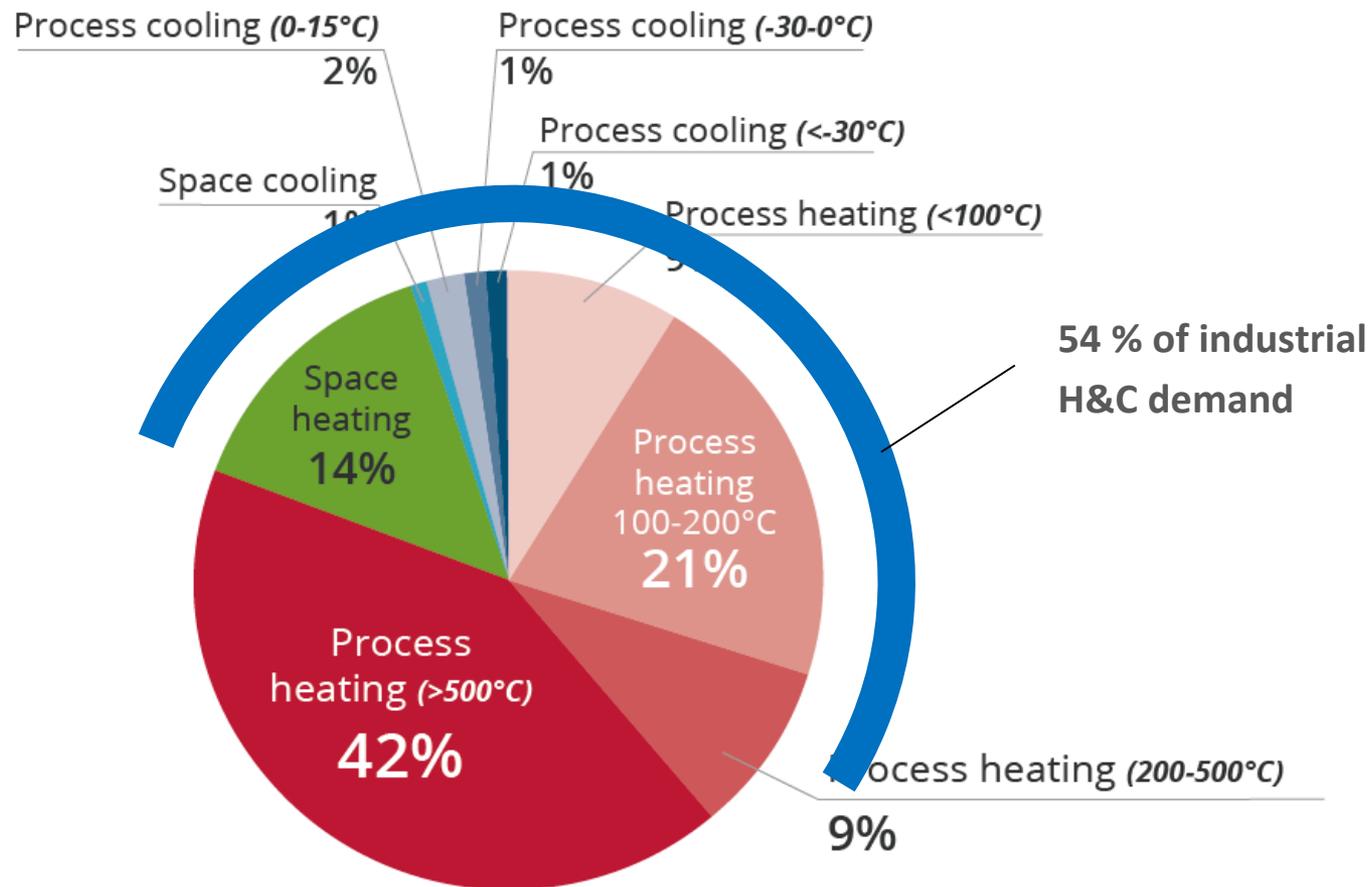

Total final energy in 2015 (EU28)

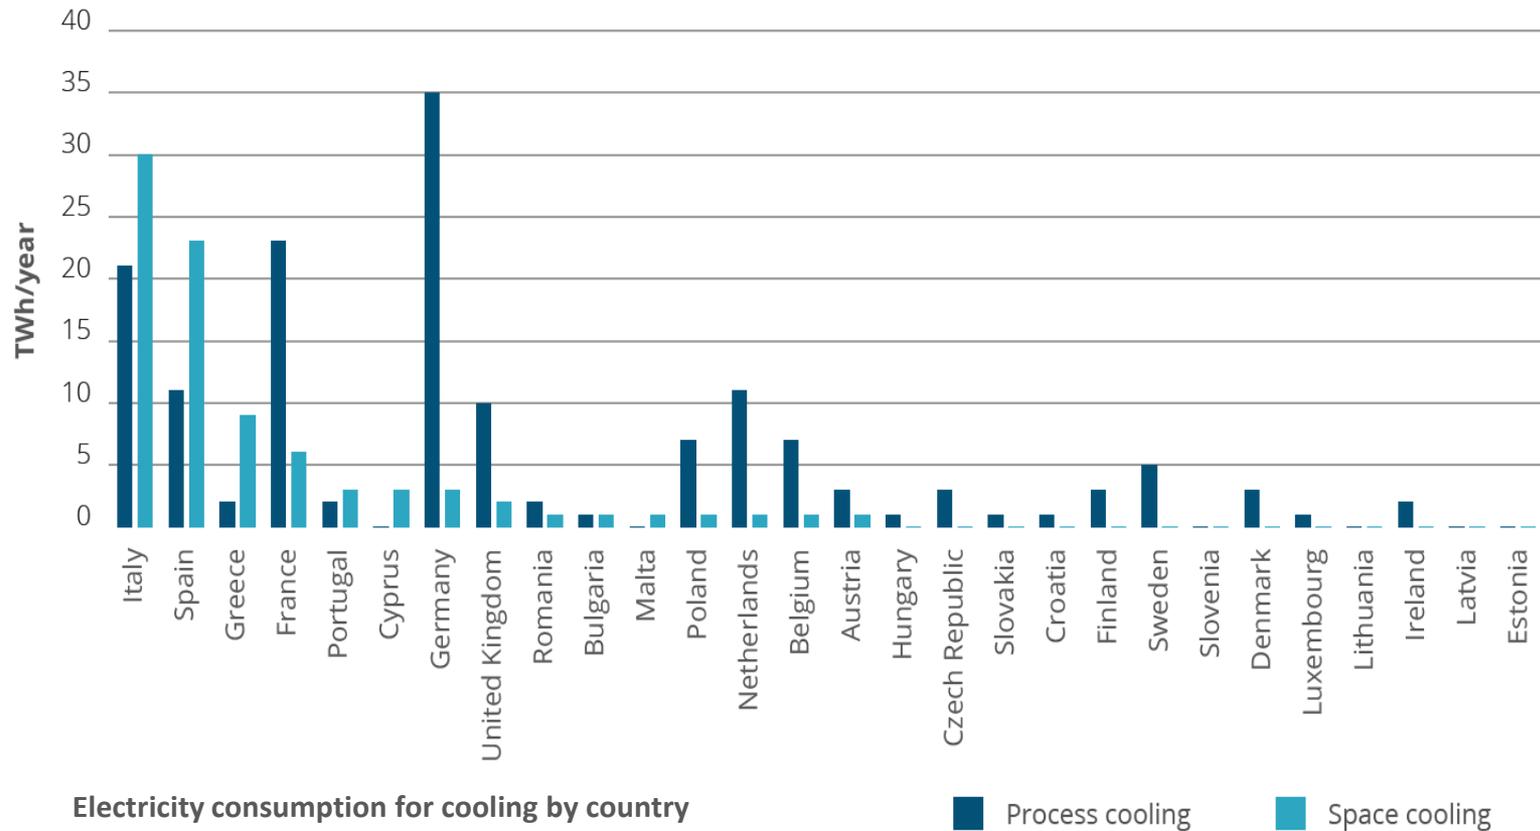

H&C final energy by end-use in 2015 (EU28)

Zoom into the *industrial* sector

Consumption for cooling by countries in EUROPE

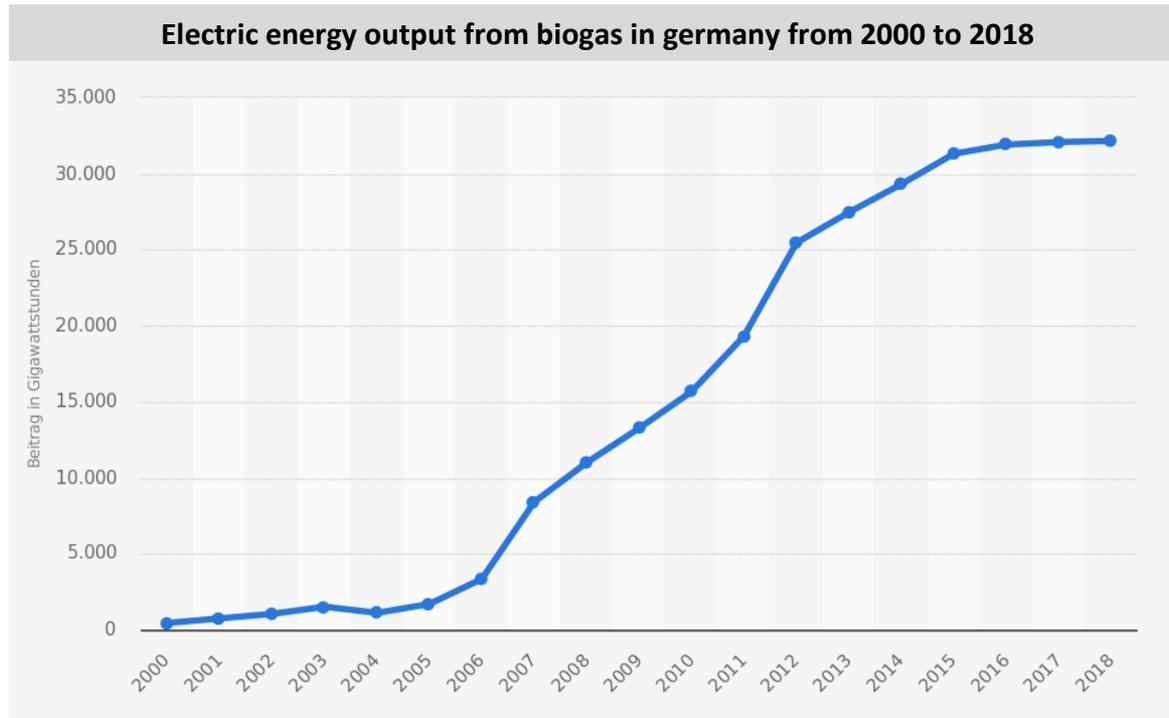

ACA-MODES

Tri-generation concepts

Non natural gas usage / germany

landfill, sewage and mine gas: => 394,2 MW (0,182 % of installed power in Germany)

but biogas production is different:

production in 2018 represents 5,9 % of the overall production of electricity or
30,5 % of the share of CHP-Power Plants

[AGEE-Stat, Statista 2019]

ACA-MODES

Tri-generation concepts

Main Applications of natural Gas Engines:

- base load, medium load and peak load power plants
- green house
- emergency power systems

Standard Design Criteria:

- full load working hours > 4500 h resulting from a duration curve
- Power range of engines 50% up to full load
- Launching requirements
- Suitable for low voltage 400 V up to 10 kV or 30 kV
- Exhaust gas limitation depending on application

[AGEE-Stat, Statista 2019]

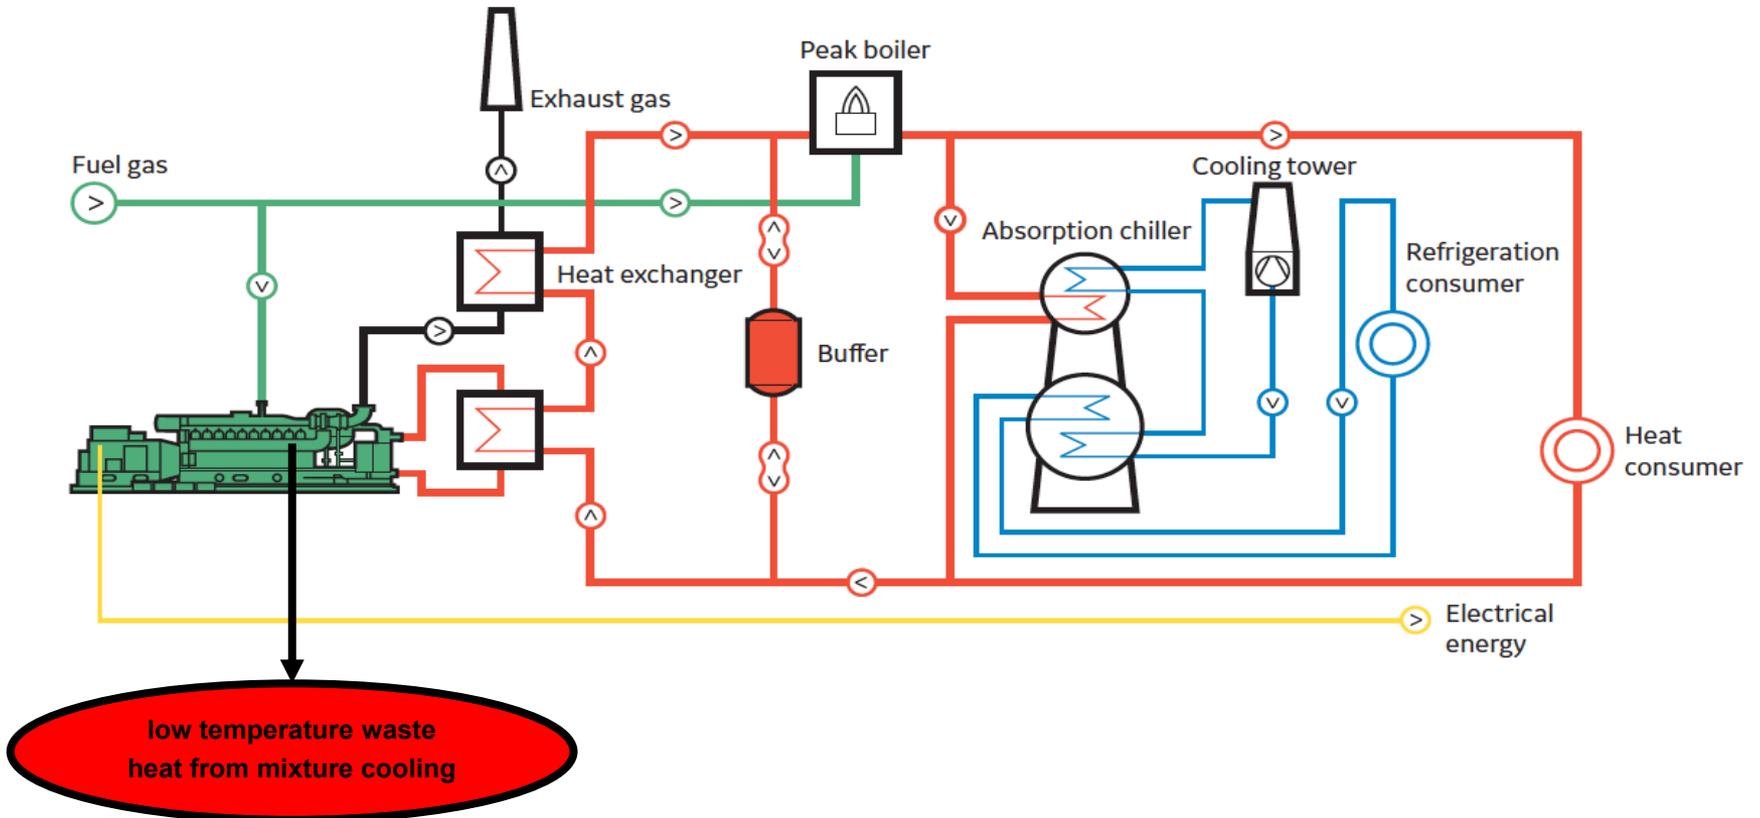

ACA-MODES

Tri-generation concepts

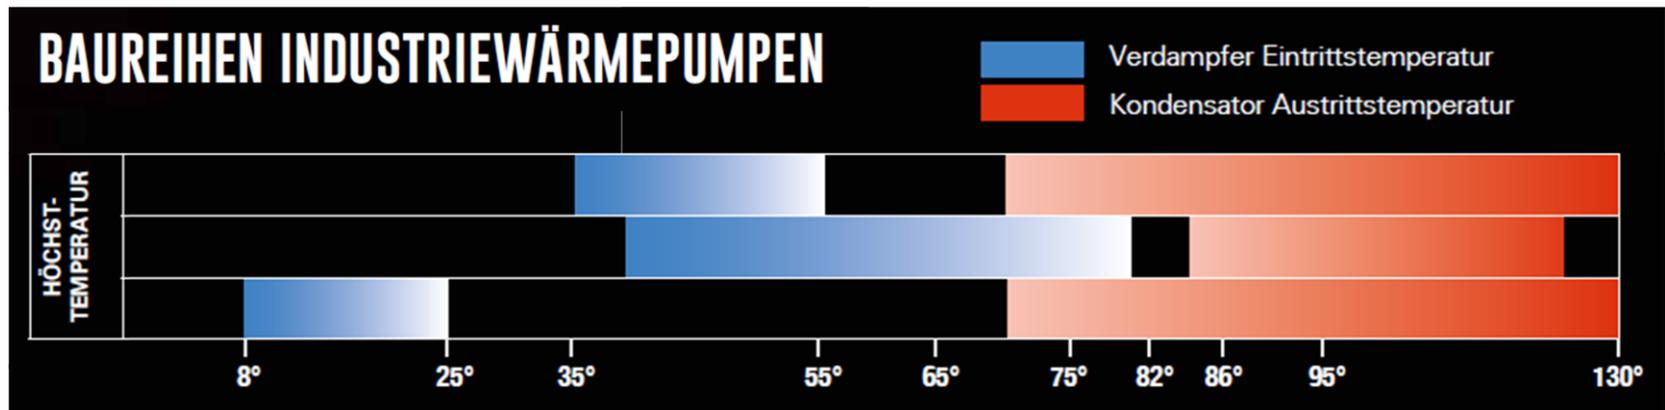

31.01.2020, Workshop

Combined Cooling Heating Power Systems/Plants

High temperature heat pumps – possible applications

- heat recovery from exhaust gas and mixture cooling
- increase district heating, district boost
- primary control power, PtH

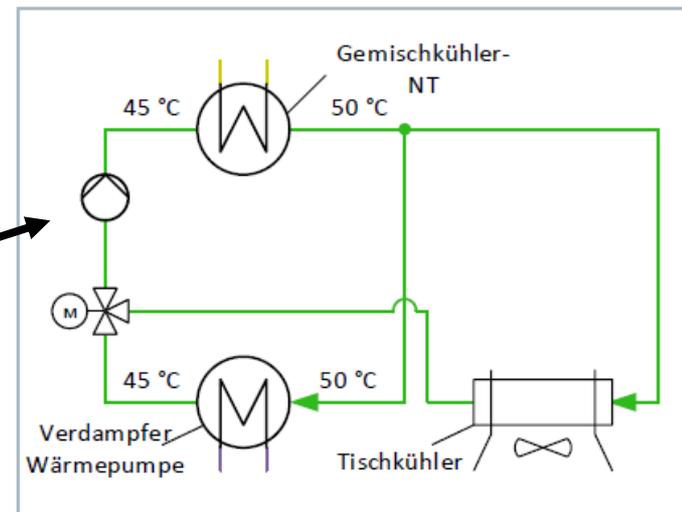

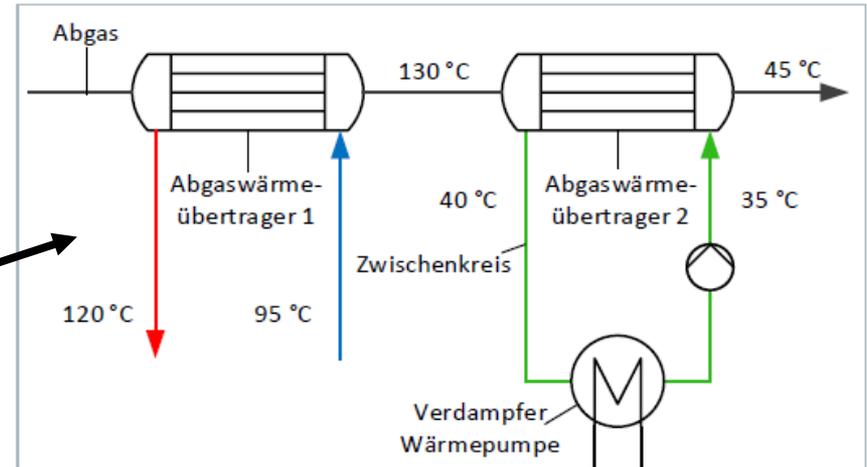

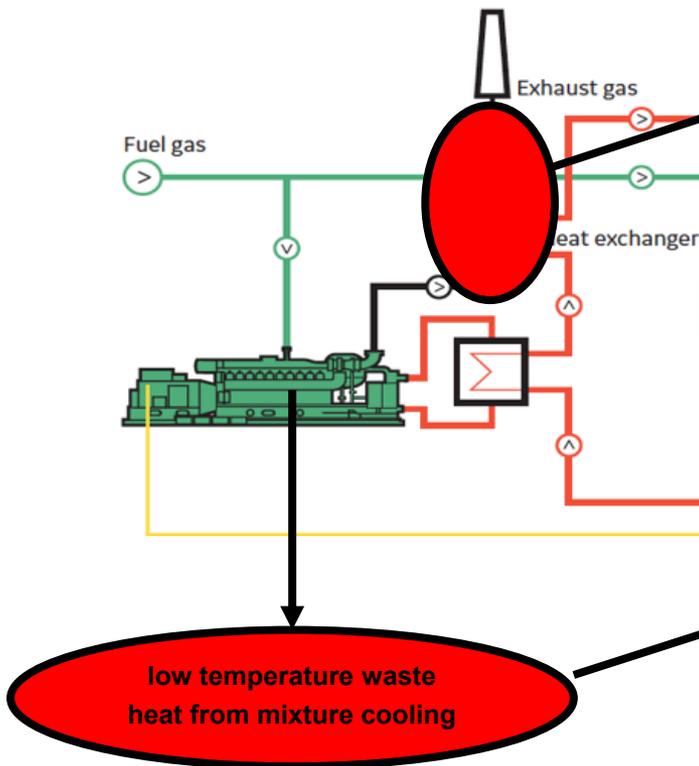

[Prospekt – Industrierärmepumpen; Ochsner Energietechnik, 2020]

High temperature heat pumps – integration in CHP

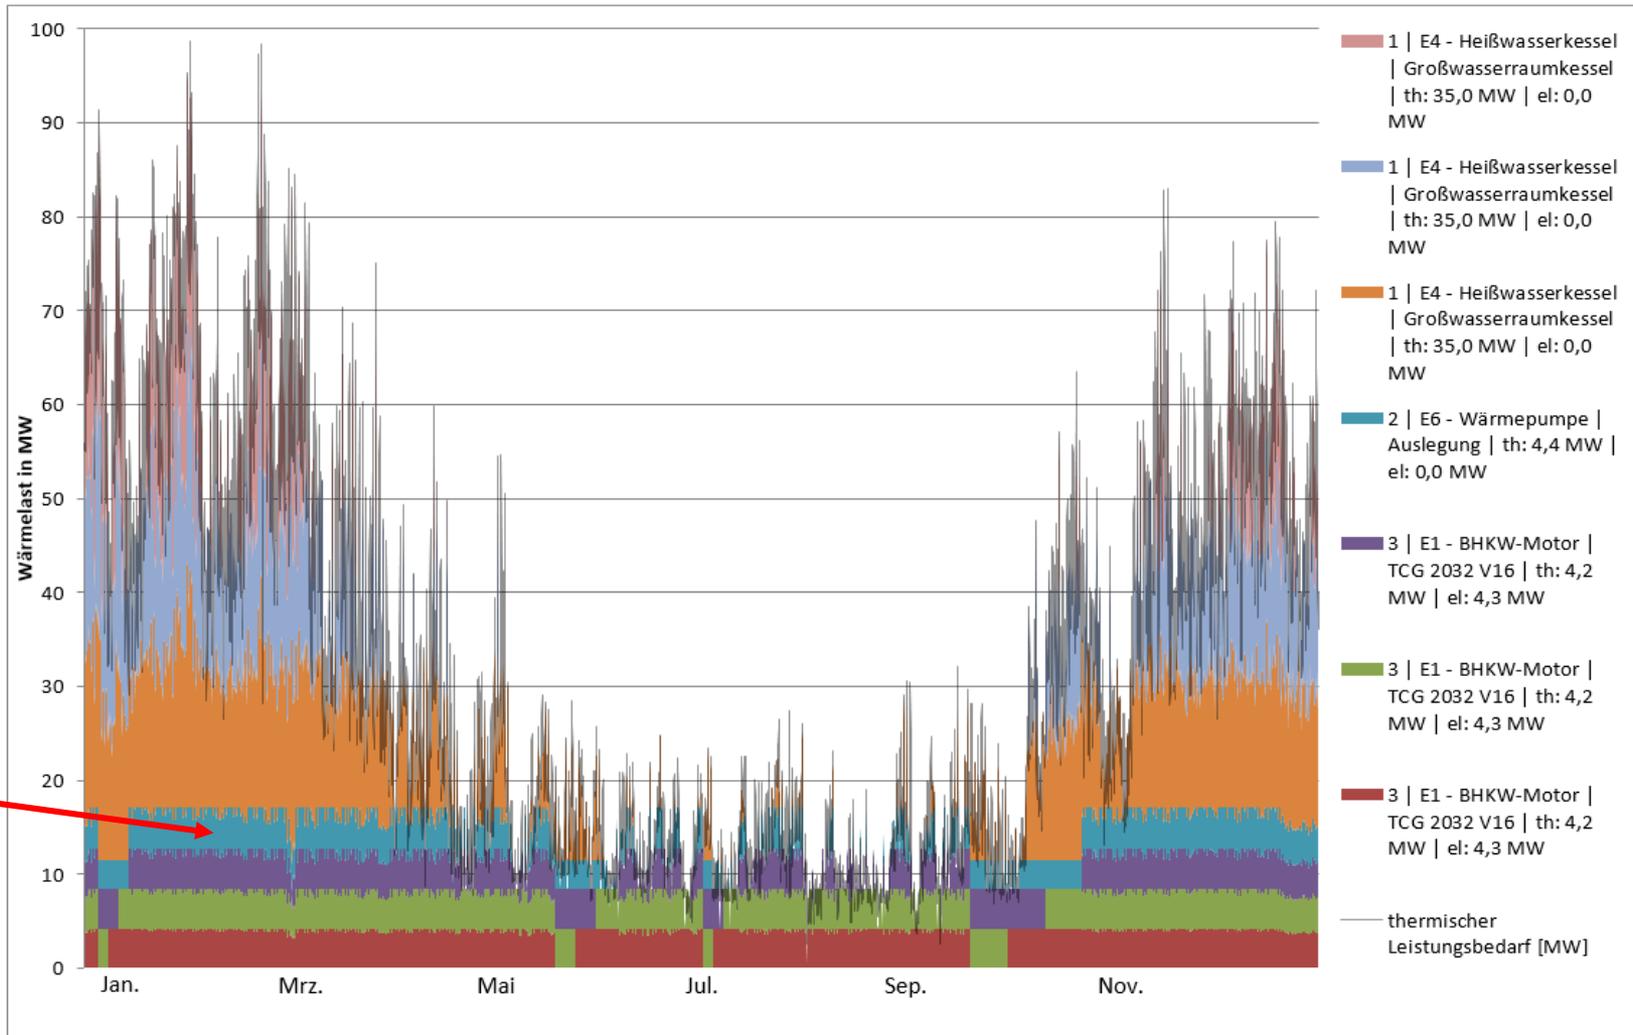

Additional P_{th} from waste heat:

Exhaust gas: 6%

Mixture cooler: 3-4 %

Load simulation with a HT-heatpump

List of components of all project partners

- 2x heat pumps (one reversible)
- 3x adsorption chiller
- 3x CHP (e.g. stirling engine)
- 1x solar heating system
- several heat and cold storages and more ...

Lab-facility at HS-Koblenz

pipes to dry
cooler (outside)

cold water
storage (1 m³)

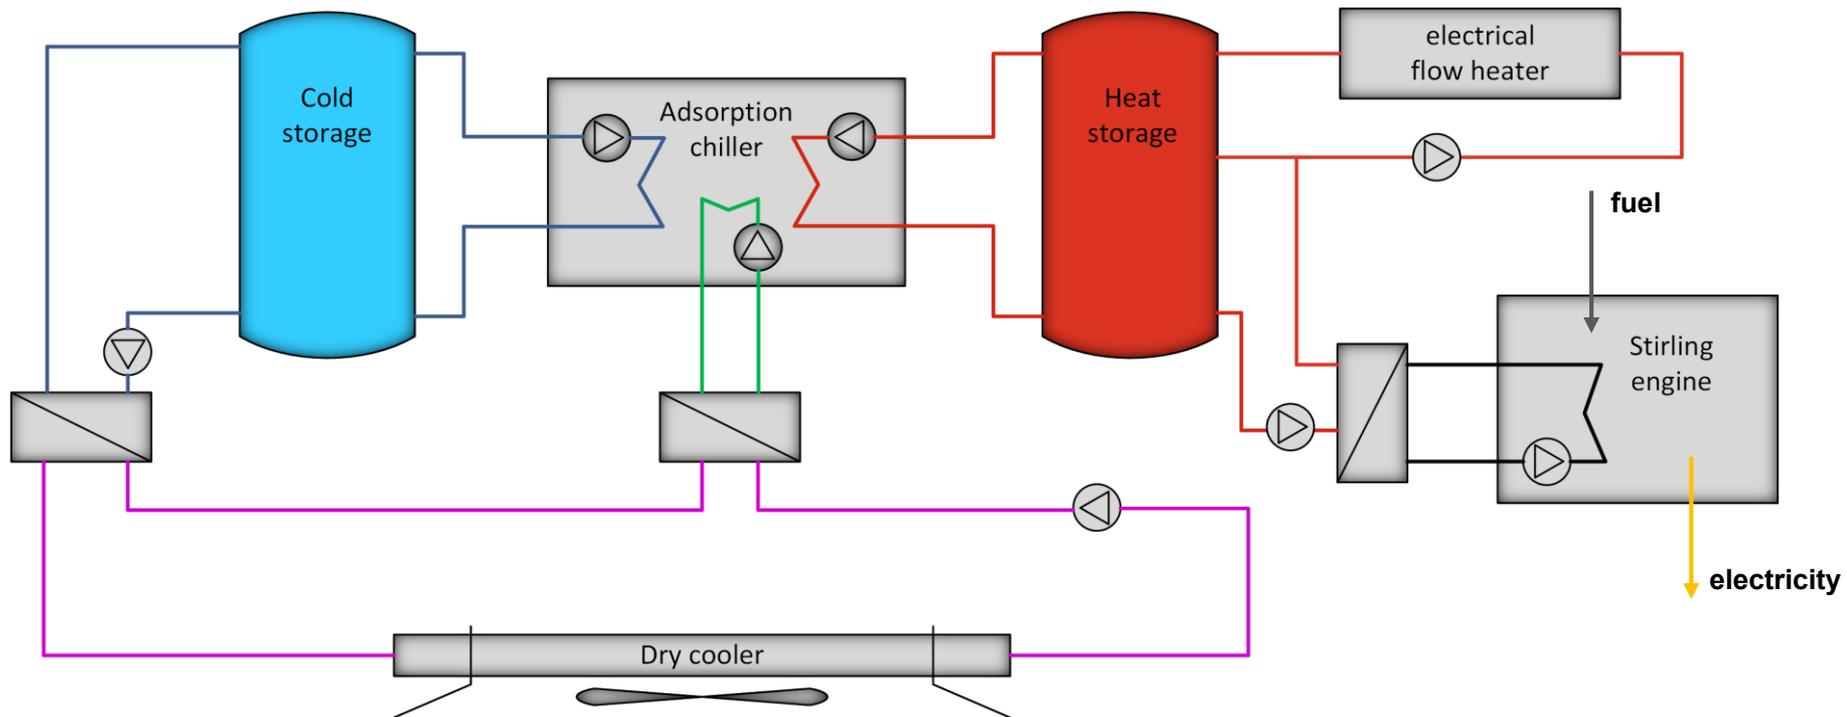

adsorption chiller
(10 kWth)

stirling engine
(CHP, 0.8 kWel,
7 kWth)

hot water
storage (1 m³)

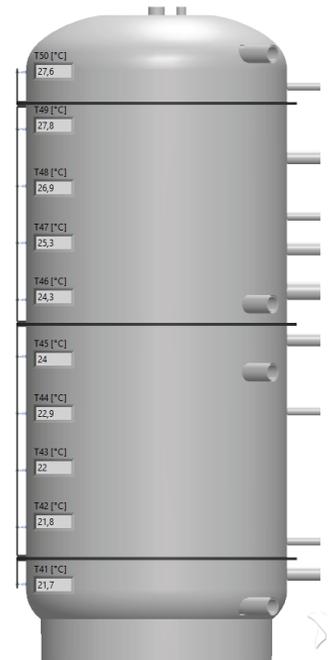

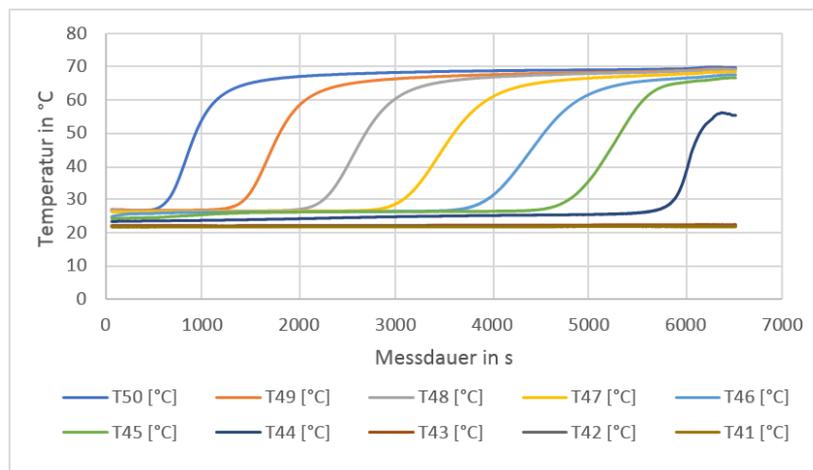

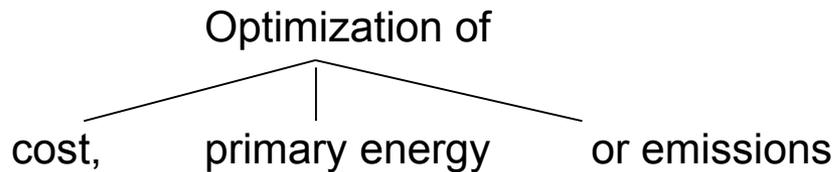

Lab-facility at HS-Koblenz

Vereinfachtes Fließschema des Labors

Examination aims

- optimal design of storage size
- part load behaviour and control of pumps, temperature levels of heat exchangers
